Acres of Chinese Cabbage on Our Paoting-fu Farm in Chili, China

The culture is the same as for spinach or lettuce. The seed should be sown any time after May and for main crop from July to September,  $\frac{1}{4}$  inch deep in the row and rows about 24 inches apart. When the plant has grown up 5 to 6 inches thin out to 10 inches apart. Cultivate well and when large enough they should be blanched by earthing up and tying closely with burlap. Any good soil is sufficient, but they seem to head up best in rich black adobe soil. One ounce of seed is enough for 500 feet of drill.

## “Paoting” genuine Wong-Bok (REGISTERED BRAND) (銹球白菜)

Big compact tender and crisp. An excellent “Wong-Bok.” We have found this to be absolutely the best firm-heading “Chinese Cabbage” to grow during the summer months. It will not scald or burn and will make a head when other varieties fail. It somewhat resembles “Kinshu” in shape and “Shantung” in character of leaf, color and size, but the head is more tightly compacted. It will produce a head of 15 pounds and will stand long before bolting to seed. It is excellent in quality; crisp, tender and brittle, with a fine celery flavor. We recommend it either for the market gardener, trucker or private planter, as it is a perfect “Chinese Cabbage” in every respect, not only being in the largest size, but of handsome color and of the finest quality. It is probably the safest variety for an amateur to plant as it does well at all seasons and one is almost sure of getting a crop. It is vigorous and free from insects. (Pkt. 10c.) (Oz. 40c.) (4 Ozs. \$1.25) (lb. \$4.50) (2 lbs. \$8.00) postpaid. This seed grown in our Potingfu Farm, in Chili, China.

The young leaves are very popular for use in salad. It is very hardy and will keep until early spring if placed in the cellar. ## Col repollo CABBAGE (キャベチ) 甘藍 カンラン

It is difficult to give definite cultural directions for cabbage, since it is possible to have good cabbage at all seasons of the year in some part of the country. Seed may be planted almost any time of the year. However, there are the seasons preferable for sowing—in September for early spring cabbages, from January to April for summer and fall cabbages, and July to August for winter cabbages. Sow the seed  $\frac{1}{2}$  inch deep and transplant the early varieties to rows 24 inches apart and 18 inches apart in the rows. They will mature in about 105 days. The late varieties mature in about 150 days and should be planted in rows 30 inches apart and 24 inches apart in the row. To prevent the heads from splitting open before they are ready to be harvested, in the plants should be bloomed a little at the root. Cabbages require plenty of moisture, but too much water causes them to rot very readily.

## Early Varieties (早生) わせ

**COPENHAGEN MARKET** (コーペンハーゲン、マーケット)—A new and early variety producing fine heads weighing 10 to 12 pounds, which are very solid and of excellent quality. It is the largest of the early round varieties. (Pkt., 10c.) (Oz., 50c.) ( $\frac{1}{4}$  lb., \$1.65) (lb., \$5.00) Postpaid.

**CHARLESTON, or LARGE EARLY WAKEFIELD** (チャーレストン)—Of the same type as Jersey Wakefield. It grows about one-third large and is ready to cut a few days later. (Pkt., 10c.) (Oz., 40) ( $\frac{1}{4}$  lb., \$1.35) (lb., \$4.00). Postpaid.

**EARLY JERSEY WAKEFIELD** (アーリー、ジャシー、ウエーキフィールド)—One of the best and most popular early varieties. Forms round, pointed heads of good size. Is very hardy and on account of its thick outside leaves is able to resist cold and other unfavorable conditions to a great extent. (Pkt., 10c.) (Oz., 35) ( $\frac{1}{4}$  lb., \$1.00) (lb., \$3.50). Postpaid.

**GOLDEN ACRE** (ゴールドデン、エーカー)—The earliest and of high quality. Plants are compact and form solid round heads weighing 3 to 5 lbs. Heads should be ready for use 60 to 75 days after transplanting. (Pkt., 10c.) (Oz., 60 cts.) ( $\frac{1}{4}$  lb., \$1.80) (lb., \$6.00). Postpaid.

## Second Early Varieties (中生) なてか

**ALLHEAD EARLY** (オールヘッド、アーリー)—The earliest of the large flat-headed varieties—Heads remarkably solid and uniform in size, of very compact growth. (Pkt., 10c.) (Oz., 40c.) ( $\frac{1}{4}$  lb., \$1.35) (lb., \$4.00). Postpaid.

**GLORY OF ENKHUIZEN** (グロリー、オブ、エンクイゼン)—Earlier than the All Seasons; of medium size, globe shaped and hand some dark green color, just right for the market. Leaves fine ribbed; outer leaves set close to permit close planting. Where this variety has been tried in market growing districts the growers have been very enthusiastic. (Pkt., 10c.) (Oz., 40) ( $\frac{1}{4}$  lb., \$1.25) (lb., \$5.00). Postpaid.

**SUCCESSION** (サクセツション)—It is a second-early variety coming in immediately after the first-early sorts. It greatly exceeds in size any variety in its season. Without doubt it is the second-early Cabbage in existence, and is so finely bred, so free from coarse veining of the leaves, that, in addition to its reliability and sure cropping quality, it possesses all the fine qualities of the very best earlier varieties. (Pkt., 10c.) (Oz., 80c.) ( $\frac{1}{4}$  lb., \$2.50) (lb., \$8.00) transportation paid.

**CULTURE**—Sow in spring, about 1 inch deep, in rows 18 inches apart, afterward thinning the plants to 8 to 10 inches. If the weather is suitable, the thinnings may be planted, but it is considered difficult to transplant. Soil should be same as for cabbage; a rich loam. Do not let the earth get into the heart of the plants and do not cover the thick stem or knob. One ounce will give about 1,500 plants, enough for 300 feet of drill. For early plants, seeds may be sown under glass in March. Tenderest while young. Sow in succession. Keep the weeds down, and when the thickened stems above ground are 2 or 3 inches through they are fit to eat, and should be used at once, being tough when old. Cook same as turnip.

## LEEK Puerro (リーキ) 米國莖葱 (ニラネギ)

When the plants are 6 to 8 inches high, transplant in a deep, rich soil, in rows, 12 inches apart and 6 inches in the rows, as deep as possible, so at the neck may be covered and blanched; draw the earth to them as they grow. The seed may also be sown in August or September; plants transplanted in the spring.

Postpaid.

**GIANT MUSSELBURGH** (ヂャイアント マツセルバーグ)—A fine variety, having good, thick stems which are also long. Very vigorous and of sweet mild flavor. (Pkt., 10c.) (oz., 30c.) (¼ lb., 90c.) (lb., \$3.00) Postpaid.

# *Lechuga* **LETTUCE (レスタ)** 玉ちしや

If interested in larger quantities, please write us for special prices)

Lettuce seed should be covered very shallow to secure germination, especially the black seeded, if sown under glass or in the house. For early spring use, sow in September and protect through the winter in cold frames, the same as cabbages, or sow in hot beds in March and transplant to open ground as soon as it can be worked. For late supplies sow in open ground as soon as the season will permit, in rows one foot apart; thin out plants one foot apart in rows. If sown every two or three weeks to the middle of August, it may be had in perfection the entire season. One ounce will sow 125 feet of drill and produce 3,000 plants.

The vine is a rampant grower. The first year from seed it will grow twenty to thirty feet. Destroyed to the ground by frost, it soon sends out new growth, and during the second season will extend vines forty or fifty feet in every direction. During September it starts blooming, having a small, white, insignificant flower. Within four weeks the fruit is larger enough for the table. One vine in two years if properly trellised will produce more than one thousand fruit. Price 50c. each postpaid. Orders shipped January, February and March only.

## Mushroom Spawn

### Cultural Directions

マツシ ルーム スポーン

(茸の種子)

Ten pounds will spawn about 10 feet square. Mushrooms can be grown in any dark room or cellar where the temperature can be kept at from 50 to 70 degree. From some old pasture procure good, rich soil, and to every bushel of this soil add 2 bushels of fresh horse manure. Of this well-mixed compound prepare a bed, say, 4 feet wide. Put down a thin layer and pound it down hard, and go on until you have a bed 12 or 18 inches thick. As soon as the temperature of the

bed falls from 75 to 50 degrees, the spawn may be inserted in pieces about the size of a walnut, about 2 inches deep and 6 inches apart. Cover with loamy soil about 2 inches deep and beat it down evenly and firmly. Finish off with a covering of clean hay, about a foot thick, and the work is done. If the temperature is right, in 6 or 8 weeks you may expect mushrooms. The beds will continue bearing from 20 to 30 days. After the first crop is gathered spread over the bed an inch of flesh soil, moisten with warm water, and cover with hay as before. The main conditions in mushroom growing are proper and uniform temperature and very rich soil.

### CHINESE BUTTER BEAN GOURD

One of the Chinese Curiosity and is a member of the edible gourd family and in growth is similar to the squash, and can be grown in the same manner or can be trellised up. It is wonderfully prolific, considerably more productive than squash and much easier to grow. The vines are always free from disease and insect pests, and really stand more neglect and abuse than any other vegetable vine we know of.

Fruit grow to four, five feet long and 4-5 inches in diameter, which combines the flavor of the delicious marrow with the finest French beans. To serve, take fresh from the vine, a young gourd bean about 15 inches long or smaller, while the fuzzy growth is yet on. Cut into cubes about an inch, bring to a boil, pour off the water twice. Season well with salt and pepper and butter. You will be surprised how it is. Extremely economical. Culture is same as for cucumbers or squashes. (Pkt. 10c.) (Oz. 25c.) (1/4 lb. 80c.) It grows on a vine somewhat similar to a watermelon vine. It may be trained to grow on a trellis from which the fruit will hang like a gourd. Plant about May 1st about the same as cucumbers.

Many women prefer a dishcloth made of this gourd to anything else, as it is always sweet and clean as long as any part of it is left. Culture is same as for cucumber and melon. (Pkt. 10c.) (Oz. 20c.) (1/4 lb. 35c.) (lb. \$1.00) Postpaid. Imported Seed.

For extra early onions the seed should be sown in beds from August 1st to October 1st. Transplant when they are as large as lead pencils 5 inches apart, in rows 15 inches apart during December and January, as the plants will be large enough by that time.

## EARLY FLOWERING SPENCER (早咲)

This splendid group has justly earned signal recognition from a great body of American planters, particularly from the commercial growers for forcing under glass. It deserves more attention from the home gardener who has possibly been disappointed in his results with the later sorts, as it comes into bloom from three to four weeks earlier and therefore should be well in flower before our summer heat arrives. Besides they enjoy a very long blooming season and where cool nights are the rule they will continue to bear for months. The vines are less branching than those of the late Spencers but the blossoms are equally large, beautifully waved and carried on splendid long stems. They are ideal for late fall planting and where the winters are mild, as in our Gulf States, those bordering on the Rio Grande or in California they are used in large quantities at that season of the year.

## THE ROSE ローズ

December, January, February and March are the best months for planting but should the season be favorable you can still plant during the early part of April. The plants sent out during these months are what we call dormant two-year old budded plants. Roses give best results when planted in a fairly sunny location and in good heavy sediment soil to which may be added some old manure or bone meal, but never use fresh manure. When planting straighten out all roots and as the dirt is filled in see that it is well packed around them; this keeps out the air and encourages a new growth of rootlets. Be sure that the Rose is planted so that the point where it is budded shall be just below the surface.

## GLADIOLUS - - Late Flowering (グラジオラス)

The bulbs should be planted about 4 inches deep and 7 or 8 inches apart. Any good garden soil will make strong plants and good bloom, but a light application of any well decayed manure or good commercial fertilizer applied on the top of the ground after the plants are several inches high will aid in producing larger blooms. Keep the ground moist until the flower spikes begin to appear, then water freely. The bulbs should be taken up in the Fall, after the leaves have become yellow, and then stored in a cool, dry place, free from frost. From December to April are the months to plant Gladiolus.

# Tree and Shrub Seeds 庭木の種子

Most tree seeds are better sown in the latter part of winter or spring, though there are many that can be sown at any time, and some which must be sown while the seeds are quite fresh. Most kinds are best sown in boxes, of light, well-drained soil, covering the seed about its own depth or some of the larger ones a little deeper, press the soil down slightly with the hands. Keep in a lath house, frame, or some sheltered place and water carefully. As soon as large enough to handle, pot and grow on until large enough to plant in the open ground, where they are to remain. Pines and other Conifer seeds are best sown in March and April, use a soil containing plenty of decomposed granite and always water in the morning and not at night, as the young seedling "damp off" very easily. Acacia seeds should be soaked in hot water for twelve hours or more before sowing.

KONO

INSECTICIDE MIXTURE

"KONO" Insecticide, A-3—This new invention has the power of killing certain insects where other remedies have failed. It is very effective for use in garden, truck farms, and flower nurseries, especially for the control of red spider, aphids, caterpillar, white and green fly, thrip, also against snails and slugs.

This form of liquid spray will be found to be very much more effective than the dry, or powder sprays, because the liquid made more "CARRYING" by the soap bubbles, will cover, and cling to the under as well as the upper surfaces of the leaves, also, it will not blow off as will the powder form of insecticide spray.

## DIRECTIONS FOR USE

Use 1/2 pound A-3 "KONO" Insecticide in fifty gallons of water. If necessary, stronger solutions may be used down to twenty-five gallons of water without injury to plants, vegetables, or trees (five teaspoonsful for one gallon of water).

# Japanese Giant Chrysanthemums 日本秋菊

The Chrysanthemum is the queen of autumn flowers. Nothing is more beautiful as house plants, in the late fall and early winter, than these large, fluffy, Japanese varieties. For massive blooms, grandeur of colors, ease of culture and certainty to flower there is no plant that will surpass them. The endeavor of nearly all growers has been, in late years, to introduce varieties which will produce the largest and finest blossoms for exhibition purposes. It is from these varieties that this seed is saved. These plants are easily raised from seed. Almost all the new and striking varieties are the result of plants grown from seed, and the amateur, is as liable to originate new and splendid varieties as is the professional florist.

They are of the easiest culture and always give satisfaction as house plants. The blossoms you get will surprise you with the odd and beautiful forms of the flowers and abundance of bloom. If you want a magnificent collection of these gorgeous Chrysanthemums—red, white, yellow and pink—you will make no mistake in getting a packet of our select seed.

We sell the seed in packets only, and guarantee it to be from the genuine large flowered Japanese varieties, imported seed. (Pkt. 25c.; 3 pkts. 60c.; postpaid).

## Choice Chrysanthemum Plants

Set out the plants about 2 feet apart in well fertilized ground. After the young plants have grown 2 inches pinch them back 4 inches, then each plant will send out from 3 to 4 stems. In order to give strength to the blossoms, cover the ground with a layer of an inch or two of decayed manure. As soon as the buds appear on the stems, let the largest remain and pinch off all others.
